

Storageflex™ Double-Take®

- Continuous, asynchronous, byte-level replication
- Unlimited distance replication
- Hardware independent
- Application independent
- Certified Windows compatibility – Gold Level
- Exclusive resource planning tool
- Bandwidth Throttle Control
- High availability and failover
- Integrate with existing backup solutions
- Queued task processing with Unlimited disk queuing
- Windows Server 2003 clustering support
- Use standard network protocols
- Many-to-one failover
- Protect Exchange, SQL, Oracle, NAS, SAN and more

About Storageflex™ Inc.

Formerly Legacy Storage Systems, Storageflex™ Inc. has been designing and manufacturing Mass Storage Devices since 1983. Storageflex™ Inc. is a Proud Canadian Based Corporation headquartered in Toronto, Canada. All products are made under ISO 9001:2000 Standards

Quickly restore access to data and applications

When disaster strikes, Double-Take® can immediately re-assign the source server ID to a target server. You're up and running again in minutes with minimal or no loss of data and productivity. Compare that to the hours or days required to rebuild a server from tapes.

Replicate over any distance to any location

Unlike costly synchronous mirroring solutions that limit your geographic options or require specialized network connections, Double-Take® works over any distance using your existing IP networks. Locate your target server as far away as you would like to ensure maximum protection against outages or disasters.

Don't sacrifice performance for protection

By replicating only the bytes that change, Double-Take® uses the absolute minimum bandwidth required to back up your data. Plus, powerful advanced features let you control bandwidth usage and queue data changes for replication during off-peak usage times.

Protect your existing investments

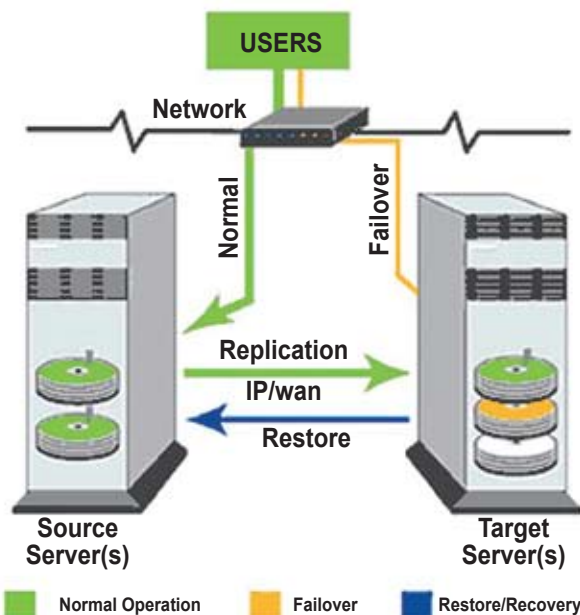

Double-Take® is server, storage, and network independent - it works with the applications you have today and will work with whatever best-of-breed hardware and software you need tomorrow.

**Continuous Data Protection and Disaster Recovery...
at a price that makes sense!**

Sure, you back up your data. But how frequently? How much data would you lose in a disaster between backups? How quickly can you recover from a disaster? How long would you be without access to critical applications and data?

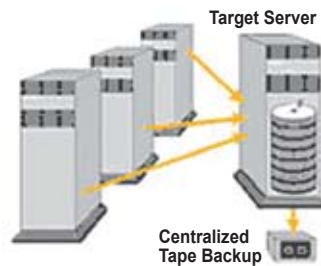

Storageflex™ Double-Take® goes beyond periodic backup to provide continuous data protection and to ensure minimal data loss and immediate recovery from any disaster or system outage. Double-Take® utilizes patented replication and failover technology which continuously captures byte-level changes as they happen and replicates those changes to one or more target servers at any location, locally or at a recovery site miles away. In the event of a disaster, Double-Take® lets you recover from your target servers in minutes, if not seconds. What's more, host-based Double-Take® delivers better protection than many hardware-based solutions, and it costs tens of thousands less. Start with as few servers as you like, scale organically as your data requirements grow and get a fast and continuing return on your investment.

How Double-Take Works

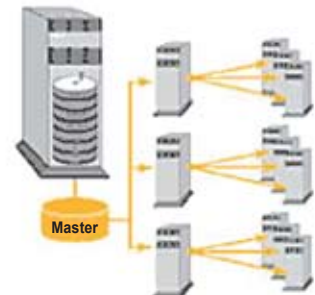

Other Applications

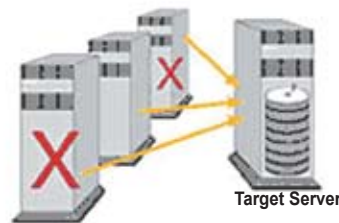

Backup Enhancement

Data Distribution

Local High Availability

Server Failover with full redundancy, Zero Backup Window, SAN Free Backup, Instant Restore and Disaster Recovery...All rolled into one simple solution!
